1.1 Design Guidelines

1. Select products appropriate for use and substrate on a case by case basis. Review proposed products with WMU Project Manager.

2. Use of water repellants should be avoided at brick masonry, especially at new construction.

3. Field testing should be done prior to application of products.

4. Water repellants should only be used to remediate moisture problems.

2.1 System Description

1. Water repellants such as silicone and acrylic types, which allow construction materials to breathe and avoid trapping of moisture, are preferred.
